Effelsberg and LOFAR

Anderson/MPIfR

What Is "Single Dish Radioastronomy"?

- Obviously, it is what you do if you only have a single (big) dish
 - But not everything you do with a single dish is really single dish radioastronomy
 - The single of single dish is not really the important part
 - Nor is the dish, for that matter
- Single dish radioastronomy is what you do when you don't want to do radio interferometry
 - Interferometry: multiplying cosmic signals
 - Non-interferometry: adding cosmic signals, multiplying a cosmic signal only by itself or by a frequency standard (mixing)
 - Note that additive interferometry for centimeter and longer radioastronomy is really used for what we think of as "single dish" techniques to the astronomer today

LOFAR

DFG Magnetism, Irsee, 2010 Oct 05

Typical Single Dish Applications

- Flux density monitoring
 - I don't care what it looks like, I just want to know how bright it is and whether or not that brightness changes
- Spectral measurement
 - I don't care what it looks like, I just want to measure part of the spectrum
- High time resolution
 - I don't care what it looks like, I just want to measure the brightness to look for really fast changes
- Total power measurement/imaging
 - I do care what it looks like, and my interferometer does not measure (part of) what I need
 - Zero-spacing measurement

LOFAR

• At the individual element (dipole) level

- At the station level
 - A single International Station is equivalent to a ~55 m diameter dish
 - The sensitivity of a single station is useful for many interesting science applications
- At the multiple-station level
 - What LOFAR calls tied-array mode, often called phased-array mode in other parts of the world
- Future instruments (read SKA) will also be able to do these things
- To be fair, many existing interferometers can do many of these things, and some can do all of them
 - You have to look carefully at the performance properties of individual instruments, and choose the instrument which best suits your scientific goals

DFG Magnetism, Irsee, 2010 Oct 05

"Single Dish LOFAR" By LOFAR KSPs

- Cosmic Magnetism
 - Zero-spacing information
- Deep Extragalactic Surveys
 - Zero-spacing information
- Epic of Reionization
- Solar Physics and Space Weather
 - High time resolution spectral monitoring of the Sun for Solar flares
 - Flux density monitoring of interplanetary scintillation
- Transient Sources
 - High time resolution observations of pulsars and planets
- Ultra High Energy Cosmic Rays
 - High time resolution observations of cosmic-ray induced radio pulses

DFG Magnetism, Irsee, 2010 Oct 05

So, What Is LOFAR and Why?

DFG Magnetism, Irsee, 2010 Oct 05

General Antenna Types

<u>Wavelength < 1 m (approx)</u>

Reflector antennas

Feed

<u>Wavelength = 1 m (approx)</u> Hybrid antennas (wire reflectors or feeds)

10/51

DFG Magnetism, Irsee, 2010 Oct 05

Types of Antenna Mounts

- + Beam does not rotate
- + Better tracking accuracy
- Higher cost
- Poorer gravity performance
- Non-intersecting axis

- + Lower cost
- + Better gravity performance
- Beam rotates on the sky

+ Cheap material cost

- + Constant gravity performace
- Beam does not point at target
- Station beam different for all directions on sky
- Gain different for all directions on sky
- Pushes most of the problems into software

DFG Magnetism, Irsee, 2010 Oct 05

LOFAR: The Low Frequency Array

- Aperture array technology
 - digital processing
- Low Band (LBA)
 - normally 30 to 80 MHz
 - can do 10 to 80 MHz
- High Band (HBA)
 - 120 to 260 MHz
- 3rd input

Orginal LOFAR

- open at International stations
- extra LBA inputs for Dutch stations (better performance < 30 MHz)

Current LOFAR

• Core (2 km diameter)

- Remote (inside NL)
- International (outside NL)

DFG Magnetism, Irsee, 2010 Oct 05

- Core area will be a nature reserve
- 96 LBA antennas (48 observing at a time) & 2 x 24 HBA tiles

Core

- 2 km diameter
- Micky Mouse design
- Station Beam FWHM
 - 8.7 6.6 5.3 2.6°
 - 30 75 120 240 MHz
- Synthesized beam
 - 800 300 200 100" _
 - 75 120 240 MHz 30

- 48 HBA tiles & 96 LBA (only 48 at a time used for observation)
- Station field rotation as well

DFG Magnetism, Irsee, 2010 Oct u5

Remote

- Up to 130 km baselines
- Circular-pair half-design
- Station Beam FWHM
 - 8.7 6.6 3.7 1.9°
 - 30 75 120 240 MHz
- Synthesized beam
 - 20 8 5 3"
 - 30 75 120 240 MHz

- 96 LBA and 96 HBA tiles
- Station rotation also applied

International

- ~1000 km baselines
- Original station design
- Station Beam FWHM
 - 9.9 4.0 2.5 1.2°
 - 30 75 120 240 MHz
 - Synthesized beam
 - 1.7 0.7 0.4 0.2"
 - 30 75 120 240 MHz

DFG Magnetism, Irsee, 2010 Oct 05

LBA

- Low Band Antenna
- 10 to 80 MHz
- Peak response ~56 MHz
- Normally filter out RFI below 30 MHz
- Bent dipole design

Dipole radiation patterns from Wikipedia

DFG Magnetism, Irsee, 2010 Oct 05

LBA

- Head contains connectors for dipole wires
- Ambient temperature amplifiers

LBA Antenna Beam

Analytic LBA dipole model by Yatawatta

- Because of high leakage terms, need to achieve effectively just as high dynamic range as Stokes *I*
 - Don't win because true Q, U, and V are small

- Linear polarization dipoles
- Sensitivity strongly depends on azimuth and elevation angle
- Strong polarization leakage off-axis
 - Antennas fixed to ground, so nearly everything is off-axis
 - Leakage typically 50%
- Little polarization sensitivity at low elevations
- Strong frequency dependence

HBA

- High Band Antenna
- 120—260 MHz
- Roughly uniform gain across band
- 4x4 dipole "tiles"

Figure 17 A sketch of a HBA antenna element

HBA

- HBA frontend board
- Connects to the 4 triangular blades of the antenna system
- Ambient temperature amplifiers

Grating Lobes

LOFAR

DFG Magnetism, Irsee, 2010 Oct 05

Station Beam Pattern

- Primary beam and sidelobe pattern not as clean as a circular filled aperture
 - HBA grid makes an especially bad grating response
- Have to pay attention more than other telescopes to beam pattern

DFG Magnetism, Irsee, 2010 Oct 05

LOFAR Band Selection

Station Electronics: Gory Details 1

• Bandpass filter

- → 10—90 MHz
- → 30—90 MHz
- → 110—190 MHz
- → 170—230 MHz
- → 210—270 MHz
- 12 bit A/D converter
 - 200 MHz or 160 MHz clock
 - Forms 100 MHz or 80 MHz bands

- RCU modes: common combinations of antenna inputs, bandpass filters, and clock rates assigned special RCU codes
 - But LOFAR can observe with any antenna input, bandpass filter, and clock rate combination
 - Low band observations with 160 MHz clock potentially important for full frequency coverage for RM synthesis and spectral line work
 - Each antenna/polarization input can chose own antenna and bandpass
 - Must use the same clock frequency

DFG Magnetism, Irsee, 2010 Oct 05

Station Electronics: Gory Details 2

- Polyphase filterbank converts the time series data from each dipole/tile into 512 (513) frequency subbands
 - 195.3125 kHz subbands for 200 MHz clock
 - 156.2500 kHz subbands for 160 MHz clock
 - 16 bit complex number (16 bit real, 16 bit imaginary) for each subband every 5.12 μs (200 MHz) or 6.40 μs (160 MHz clock)
- Beamformer hardware processes up to 248 beamlets
 - A beamlet is one subband beamformed for a specific direction
 - 248 beamlets determine maximum bandwidth available to beamformer
 - 48.4375 MHz for 200 MHz clock
 - 38.7500 MHz for 160 MHz clock
 - Arbitrary subband selection by astronomer
 - **<u>Frequency coverage</u>** not required to be contiguous
 - Calibration will work best in full production system with wide <u>frequency coverage</u>

LOFAR

Station Electronics: Gory Details 3

- 16 bit complex samples total bandwidth 48.4375, 38.7500 MHz
 - 1 beam \leq 248 subbands (48.4375, 38.7500 MHz for 200, 160 MHz clock)
 - 2 beams \leq 124 subbands each (24.22, 19.38 MHz), may reuse subbands across beams
 - 4 beams \leq 62 subbands each (12.11, 9.69 MHz), may reuse subbands across beams
 - 8 beams \leq 31 subbands each (6.05, 4.84 MHz), may reuse subbands across beams
 - 8 beams, arbitrary subband allocation (248 subbands total, 48.4375, 38.7500 MHz total), may reuse subbands across beams

• 8 bit complex samples — total bandwidth 96.875, 77.500 MHz

- 2 beams of 248 subbands each (48.44, 38.75 MHz), all subbands reused
- 4 beams of 124 subbands each (24.22, 19.38 MHz), from original 248 subband selection, may reuse subbands across beams
- 8 beams of 62 subbands each (12.11, 9.69 MHz), from original 248 subband selection, may reuse subbands across beams
- 4 bit complex samples total bandwidth 193.75, 155.00 MHz
 - 4 beams of 248 subbands each (48.44, 38.75 MHz), all subbands reused
 - 8 beams of 124 subbands each (24.22, 19.38 MHz), from original 248 subband selection, may reuse subbands across beams
- 3 x 1 GE network bandpass limits observations to ~ 30.5 (61, 122) MHz for 16 (8,4) bit modes, but full bandwidth available for all 10 GE stations

LOFAF

DFG Magnetism, Irsee, 2010 Oct 05

Polyphase Filterbank

- Similar to a discrete Fourier transform (think of the FFT)
- But uses more datapoints in the transform, weighting the points differently
- Reduces sidelobe levels in frequency-space
 - Important for RFI mitigation
- Spectral dynamic range is normally greater than 80 dB for standard LOFAR data processing

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

33/51

LOFAR Stations Are Aperture Arrays

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

MH.

Effelsberg 100 m

- A large dish such as the Effelsberg 100 m has many adjustable panels
- The panels are manually adjusted to phase up the dish

DFG Magnetism, Irsee, 2010 Oct 05

GBT

The GBT has a metrology system to monitor the positions of its panels and make continuous adjustments to keep the panels phased up (the GBT active surface)

Rachel Rosen, NRAO/AUI

Equivalents

NASA

 Optical astronomy uses adjustable segmented mirrors, deformable mirrors, and adaptive optics to phase up the telescopes

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

Phased Arrays

Adriaan Renting

DFG Magnetism, Irsee, 2010 Oct 05

CSIRO James M Anderson

LOFAR Approach

- Rather than phasing up the telescope mechanically, LOFAR phases up a station electronically
- Instead of adjusting the position of each element of the station, the delay from each element is electronically adjusted
- Cheap hardware costs no moving parts :)
- Everything drive by software :(

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

LOFAR and RFI

- Strong RFI is present at low frequencies, especially < 30 MHz
- RFI is especially problematic for single dish work

The spectral dynamic range of the LOFAR hardware helps to minimize the problem

- RFI does not spread in frequency unless the RFI is so strong that it overruns the linear range of the amplifier or A/D converter

So What Can You Do With LOFAR?

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

Single Station Development

• LOFAR "single dish" operation and software still under development

- Picture from last meeting in Bochum
- Software development for reading/storing/processing data locally
 - Reader library written by Oxford
 - Writer application being developed by MPIfR (Kuniyoshi)
 - Pulsar detection using this system at left

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

Pulsar Physics

Pulsar Science Working Group

- Pulsars normally have very steep spectra, so low frequencies are ideal for some measurements
 - LOFAR pulsar survey expects to find ~1000 new pulsars
- Many of these pulsars may only be visible at low frequencies
 - Regular timing observations can be carried out by individual LOFAR stations
- Extended frequency coverage helps to study emission region physics

All-Sky Imaging

- Image shows the first LOFAR all-sky image using standard HBA station made with Effelsberg on 2009 November 10
- International stations important for imaging large spatial scales for Milky Way and large objects
- Useful for transient searches
 - 2π instantaneous field of view
- Technically not "single dish" work, as this is really interferometry

Planets

• Simultaneous observation of Jupiter bursts with Nancay and a LOFAR station

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

Solar Spectrum

time

- Solar radio bursts correspond to flares in the Solar corona
- Emission frequency related to the height in the corona by the plasma physics (geosynchrotron emission)
- Complete 10—260 MHz coverage at 0.01 s resolution sought by Solar KSP
- Of course, the Sun has been rather quiet lately, but it is expected to pick up in activity...

DFG Magnetism, Irsee, 2010 Oct 05

Radio Spectrum

What We Want to Do in the Future

• All-sky mapping

- The Galactic emission is very large-scale, and zero-spacing information is critical
- Radio recombination lines

• ???

Jodrell-Bank 250-ft + Effelsberg 100-m + Parkes 64-m

Using LOFAR For Single-Dish Work

- Honestly, we have not worked everything out yet
 - Still under extensive development and "playing around" to see what we can do
- The ability to form multiple beams on the sky, 8 now and perhaps 24 or more in the future, opens up lots of possibilities which are impossible with other telescopes
 - Simultaneous observations of pulsars in different directions
 - Simultaneous calibration beams and multi-beam imaging with rapid changes to the beam arrangement
- Since there will be 10s of similar LOFAR stations available, simultaneous observations at different locations also open up new ideas
 - Expand frequency coverage
 - Different paths through ionosphere, Solar wind, ISM

LOFAR

DFG Magnetism, Irsee, 2010 Oct 05

James M Anderson

Final Notes On LOFAR

- LOFAR is still under extensive software development
 - Lots of software tools simply are not ready yet, or do not have full functionality
- Still a number of bugs in the LOFAR hardware/firmware system as well
- But progress is rapid, and LOFAR will soon be opened up for scientific use by astronomers
