

Faraday Depths of Compact Array calibration sources

Carlos Sotomayor

Supervisor: Dr Dominic Schnitzeler

What is the science behind this project?

- Study the properties of cosmic magnetic fields!
- But, WHY?
- Magnetism is part of the four fundamental forces
- They are present everywhere ...

- And we don't know much about their fundamental properties:
 - Origin; Structure; Evolution

What is the main goal of this project?

- Calculate Faraday Depths of ATCA calibration sources
- What is this Faraday Depth?

$$\phi(\mathbf{r}) = 0.81 \int_{\text{there}}^{\text{here}} n_e \mathbf{B} \cdot d\mathbf{r} \text{ rad m}^{-2},$$

where n_e is the electron density in cm^{-3} , \mathbf{B} is the magnetic induction in μGauss , and $d\mathbf{r}$ is an infinitesimal path length in parsecs.

- How do we calculate the Faraday Depth
 - Faraday Rotation Measure synthesis technique

Rotation Measure synthesis

Takes advantage of modern radio telescopes spectral coverage to reliably calculate Faraday depths.

$$P = ||p||Ie^{2i\chi}$$

or equivalently,

$$P = pI = Q + iU.$$

Rotation Measure synthesis

Intrinsic polarized radiation along the LOS

$$\tilde{F}(\phi) \approx K \sum_{i=1}^N \tilde{P}_i e^{-2i\phi(\lambda_i^2 - \lambda_0^2)}$$

Observed polarization per channel
weighting parameter

de-rotate the obs. pol. vectors
assuming a Faraday depth

Faraday rotation measure spectra

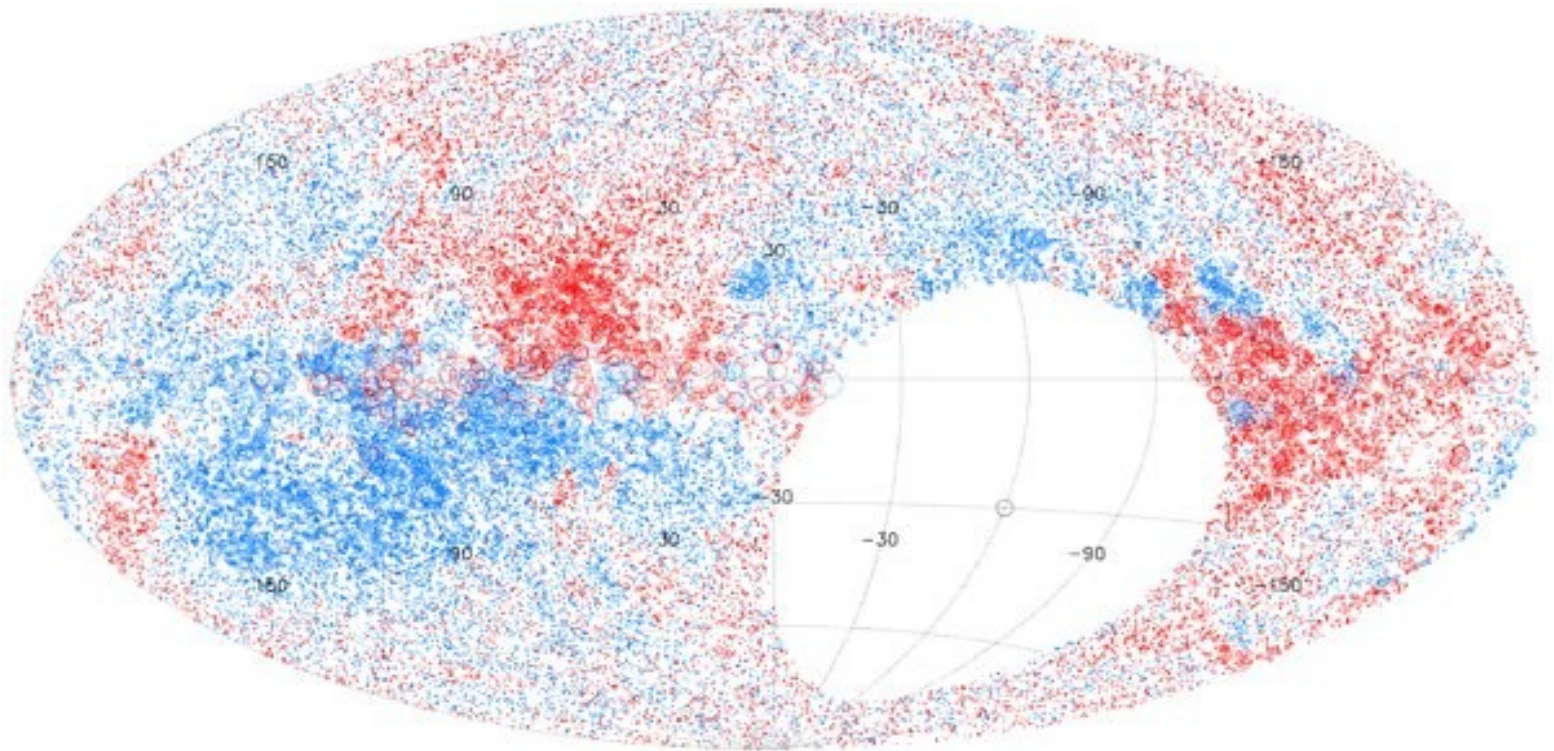

Source: 1520-58

11 channels in the L-band.

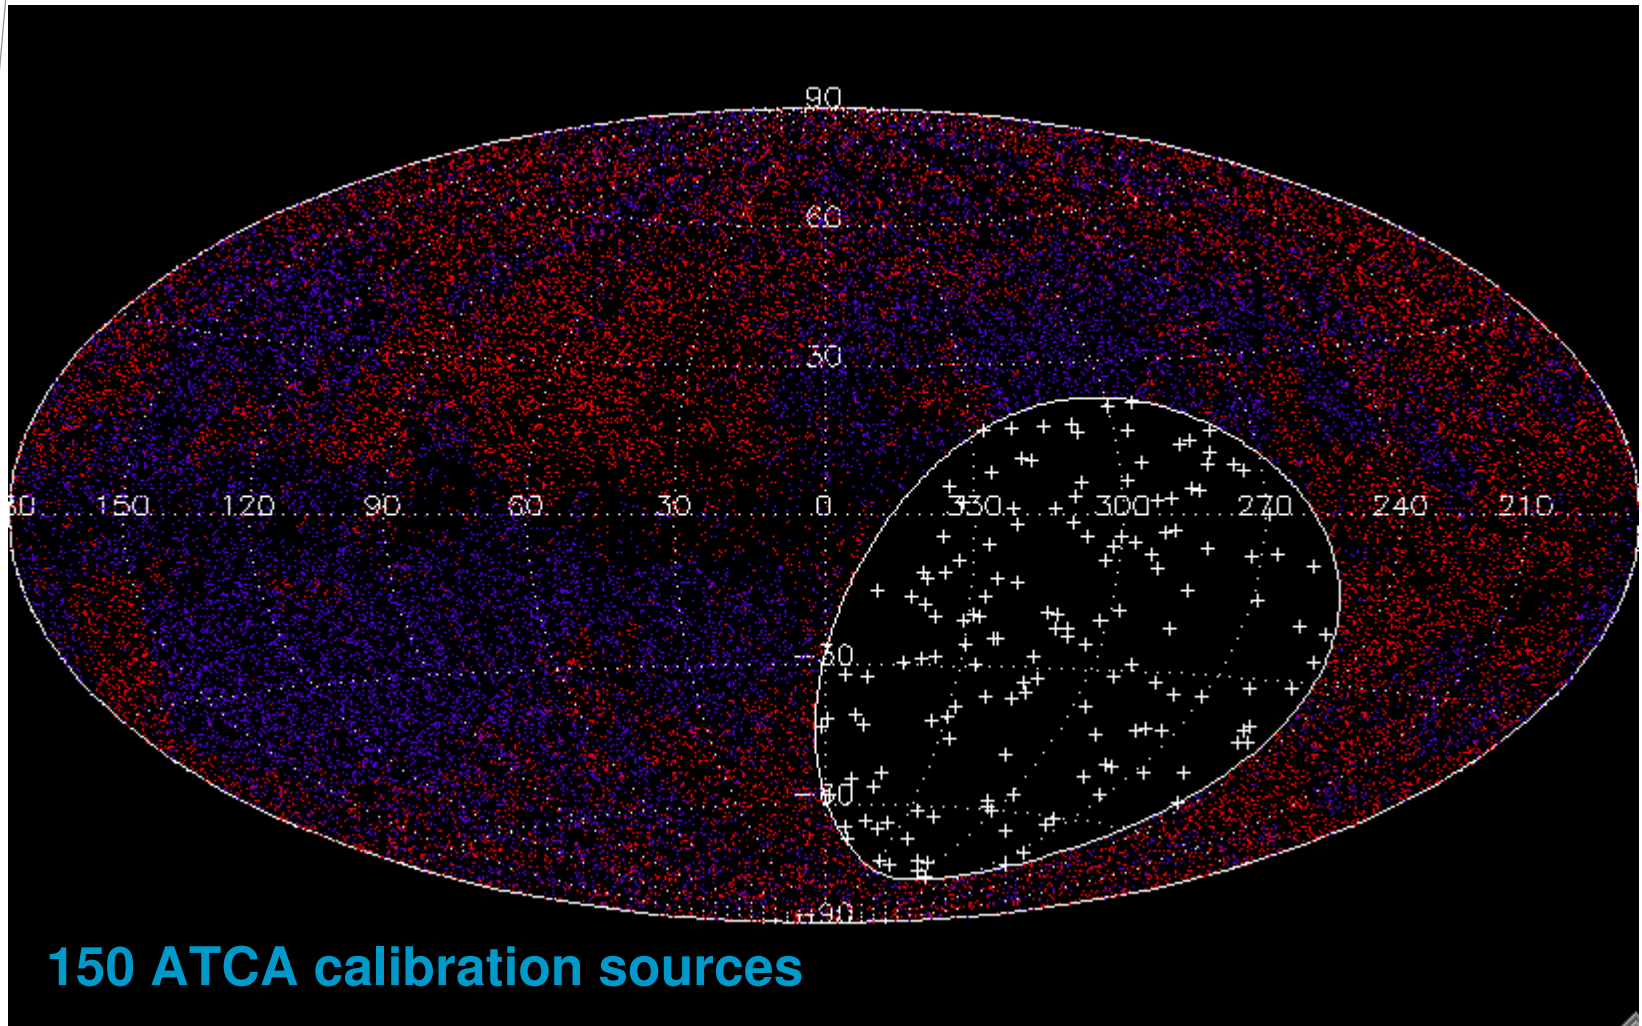

RM NRAO VLA Sky Survey

more than 30,000 RM values at dec. $> -40^\circ$

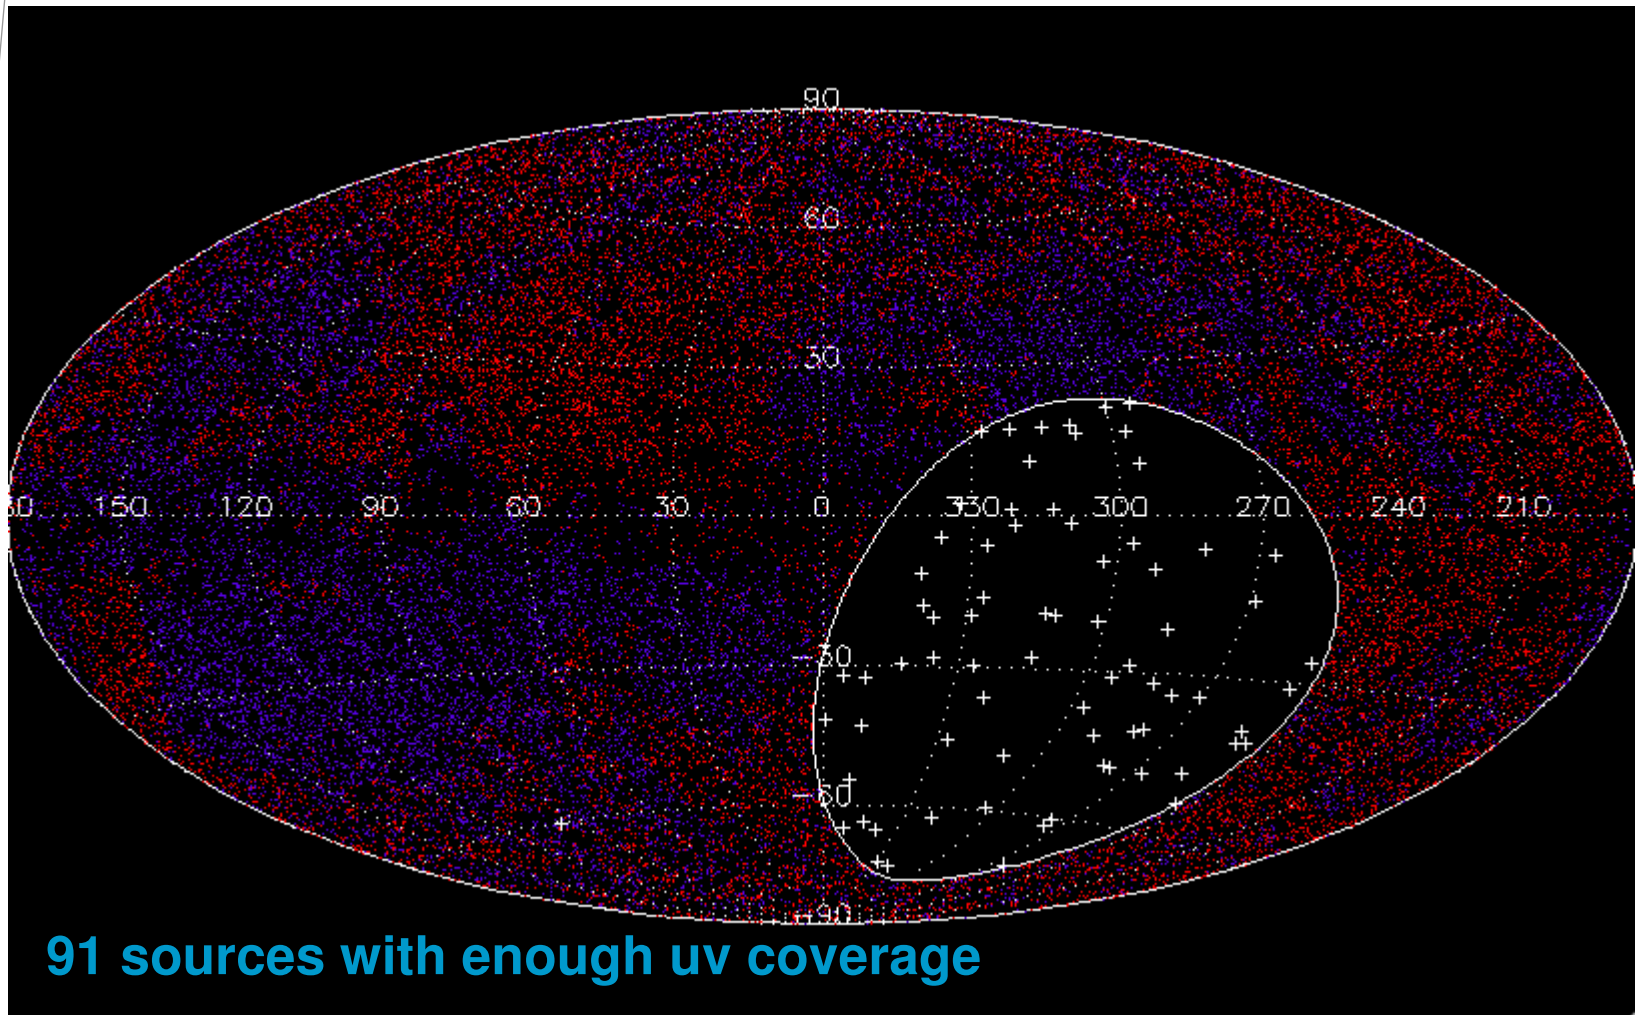

from Taylor et al. 2009

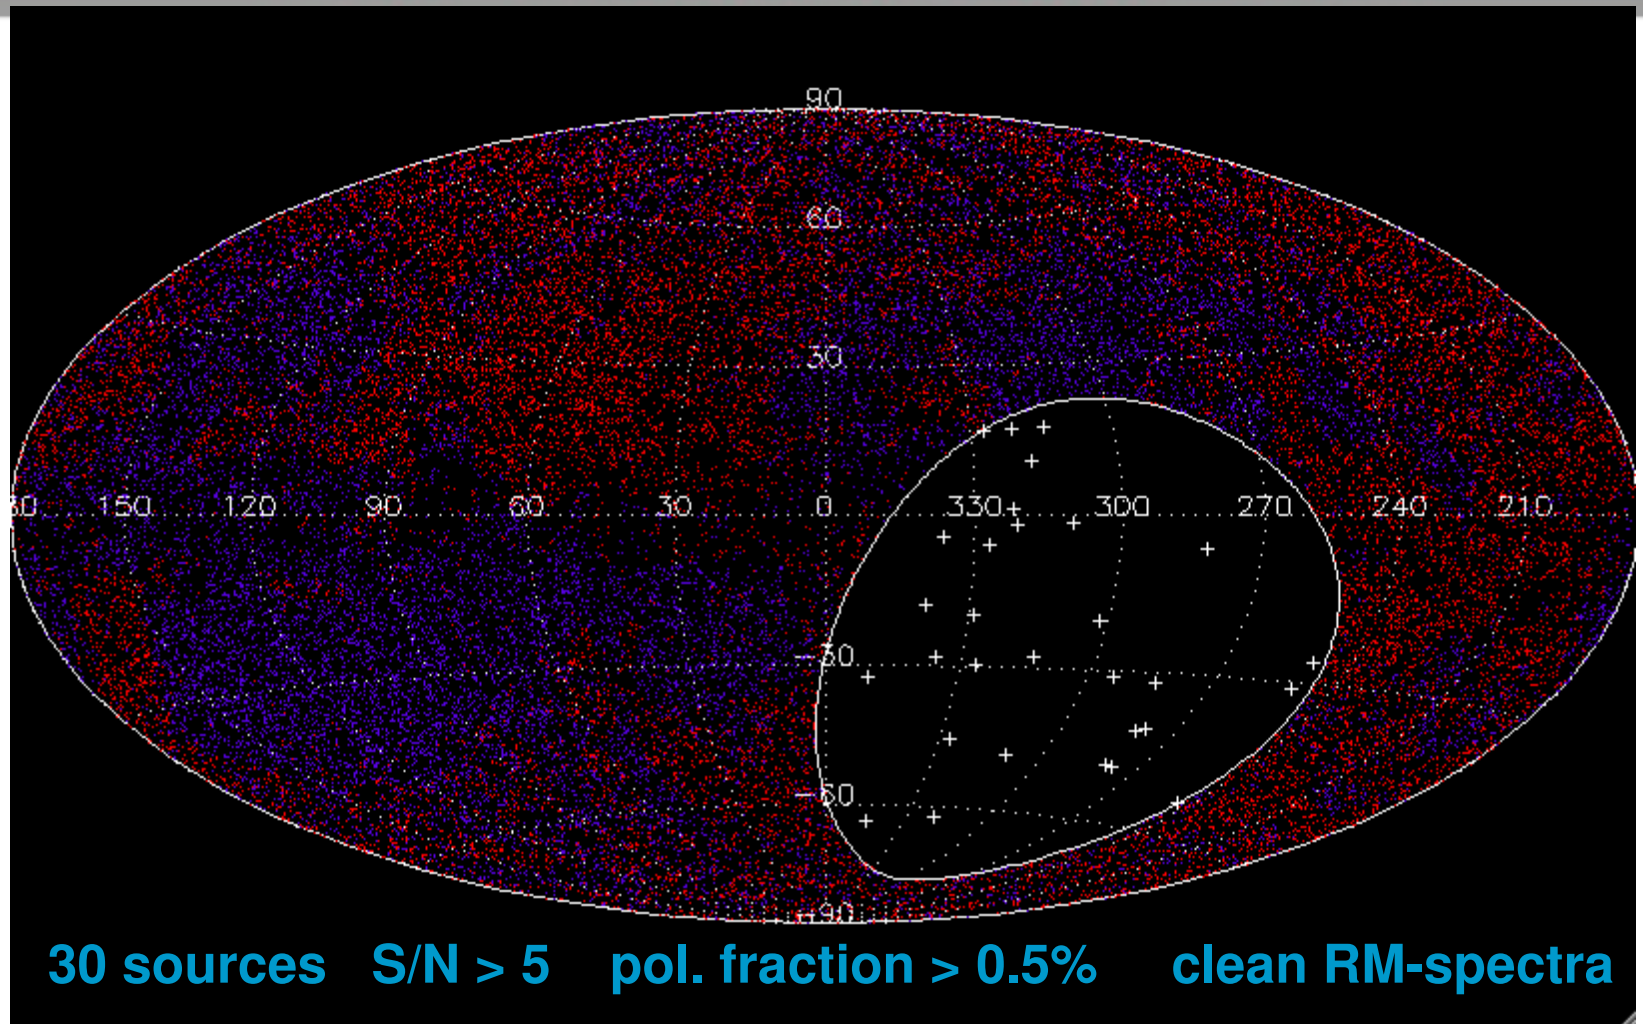

ATCA calibration sources with dec. $< -40^\circ$

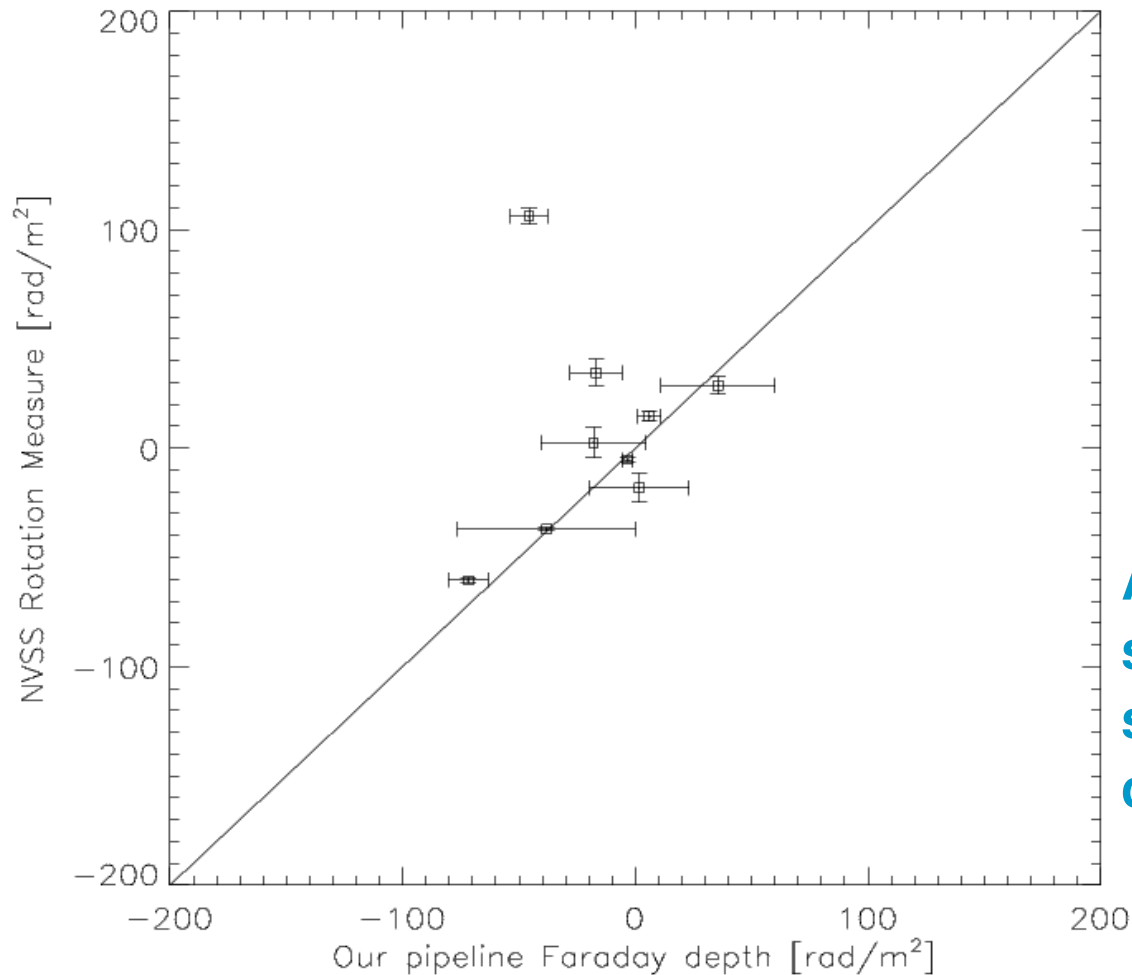

ATCA calibration sources with good uv coverage

Polarized ATCA calibration sources

Faraday depths of some NVSS sources

**ATCA calibration
sources > 1 Jy were
selected for this
comparison**

|Gal. Lat.| vs Faraday depth

H_{α} intensity map of 1352-63

very large DM

an intensity of ~ 44
Rayleigh

this map ranges from 0-
100 Rayleigh

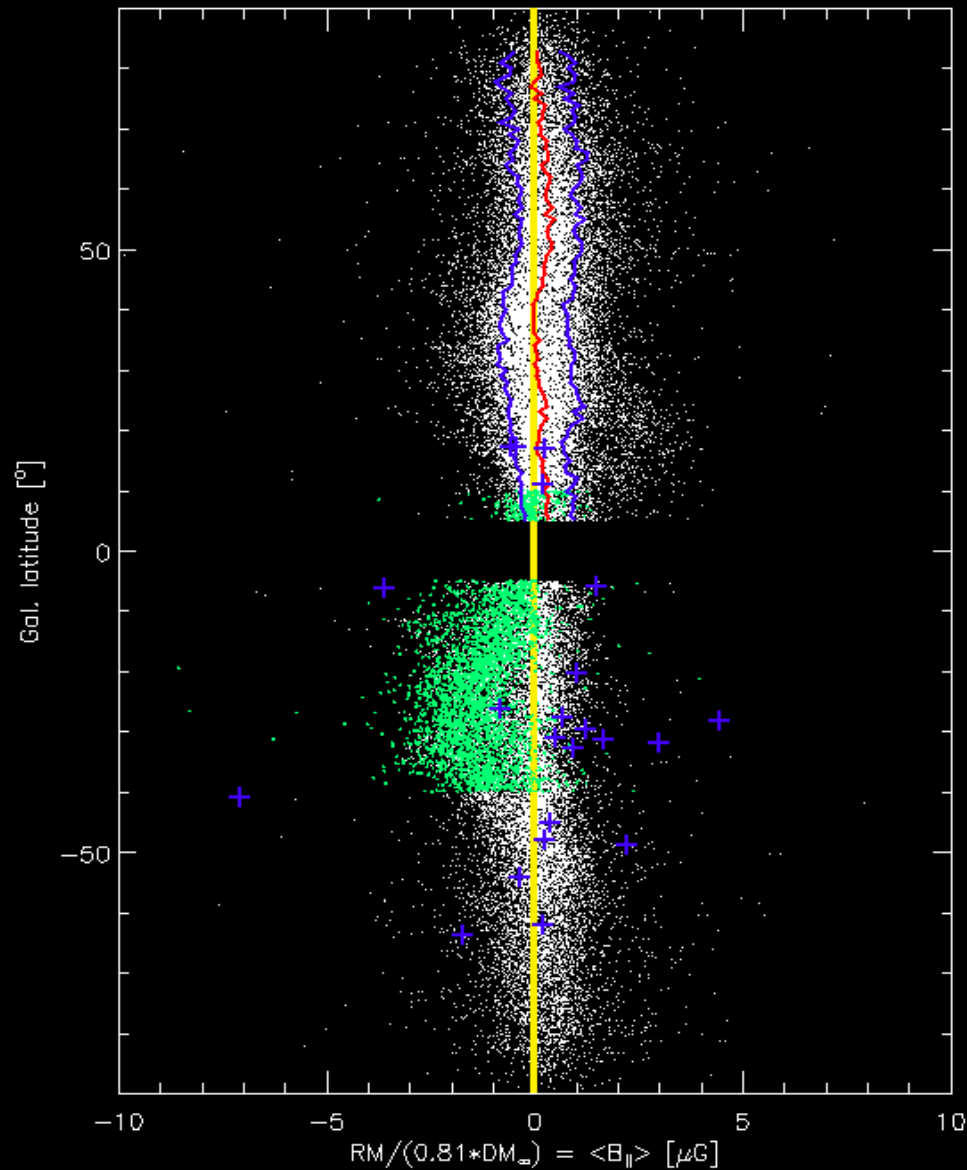

Average magnetic field along the line of sight

NVSS sources: white dots

our 30 sources: purple crosses

Same figure as before

But the NVSS sources
located in Region A are
indicated with green
points

Same figure as before

But the sources from
Region A have been
removed

**$\langle B_{\parallel} \rangle$ along positives
galactic latitudes
look similar than
before**

Conclusions/Future Work

- At high b , Faraday Depth decreases. Is it due to small electron density? weak magnetic fields? or only a effect of the line of sight?
- At low b , Faraday Depth increases. LOS effect plays a important role. high electron density. What about the magnetic fields?
- 1352-63 deserves further investigation due to its high Faraday depth. However, H_{α} map reveals high electron density.
- For positive b the $\langle B_{\parallel} \rangle$ is constant which will be further analysed.
