Max-Planck-Institut  
für Radioastronomie

LOFAR

MAX-PLANCK-GESELLSCHAFT

# Acknowledgements

- LOFAR development is performed by a very large community
- Some of the slides in this presentation have been stolen from the antennas and receiver talks of Peter Napier (2006 school) and Mark McKinnon (2010 school)
  - See <http://www.aoc.nrao.edu/events/synthesis/2010/>  
<http://www.aoc.nrao.edu/events/synthesis/2008/>  
<http://www.aoc.nrao.edu/events/synthesis/2006/>
- Many other slides explaining how aperture arrays work were taken from M Kuniyoshi

# What Is LOFAR?

- Dutch propaganda movie
  - <http://www.lofar.org/sites/lofar.org/files/u3/lofar.swf>

# The Future of Radio Astronomy: The SKA

- Show SKA movie here

# Wait a Minute!

- The Square Kilometer **Array** and the Low Frequency **Array** are both arrays
  - Why talk about them at a single dish school?
  - Why is the school called ESSEA, the European Single dish School in the **Era of Arrays**?

# Effelsberg and LOFAR

Swinbourne/Junkes

Anderson/MPIfR

# What Is “Single Dish Radioastronomy”?

- Obviously, it is what you do if you only have a **single** (big) **dish**
  - But not everything you do with a **single dish** is really **single dish radioastronomy**
  - The **single** of **single dish** is not really the important part
  - Nor is the **dish**, for that matter
- **Single dish radioastronomy** is what you do when you don't want to do **radio interferometry**
  - **Interferometry**: multiplying cosmic signals
  - **Non-interferometry**: adding cosmic signals, multiplying a cosmic signal only by itself or by a frequency standard (mixing)
    - Note that additive interferometry for centimeter and longer radioastronomy is really used for what we think of as “single dish” techniques to the astronomer today

# Typical Single Dish Applications

- Flux density monitoring
  - I don't care what it looks like, I just want to know how bright it is and whether or not that brightness changes
- Spectral measurement
  - I don't care what it looks like, I just want to measure part of the spectrum
- High time resolution
  - I don't care what it looks like, I just want to measure the brightness to look for really fast changes
- Total power measurement/imaging
  - I **do** care what it looks like, and my interferometer does not measure (part of) what I need
  - Zero-spacing measurement

# LOFAR Can Do All of These Things

- At the individual element (dipole) level
- At the station level
  - A single International Station is equivalent to a ~55 m diameter dish
  - The sensitivity of a single station is useful for many interesting science applications
- At the multiple-station level
  - What LOFAR calls tied-array mode, often called phased-array mode in other parts of the world
- Future instruments (read SKA) will also be able to do these things
- To be fair, many existing interferometers can do many of these things, and some can do all of them
  - You have to look carefully at the performance properties of individual instruments, and choose the instrument which best suits your scientific goals

# “Single Dish LOFAR” By LOFAR KSPs

- Cosmic Magnetism
  - Zero-spacing information
- Deep Extragalactic Surveys
  - Zero-spacing information
- Epic of Reionization
- Solar Physics and Space Weather
  - High time resolution spectral monitoring of the Sun for Solar flares
  - Flux density monitoring of interplanetary scintillation
- Transient Sources
  - High time resolution observations of pulsars and planets
- Ultra High Energy Cosmic Rays
  - High time resolution observations of cosmic-ray induced radio pulses

# So, What Is LOFAR and Why?

# General Antenna Types

Wavelength > 1 m (approx)

Wire Antennas

—|—|— Dipole

Yagi

Helix  
or arrays of these

Wavelength < 1 m (approx)

Reflector antennas

Feed

Wavelength = 1 m (approx) Hybrid antennas (wire reflectors or feeds)

# Types of Antenna Mounts

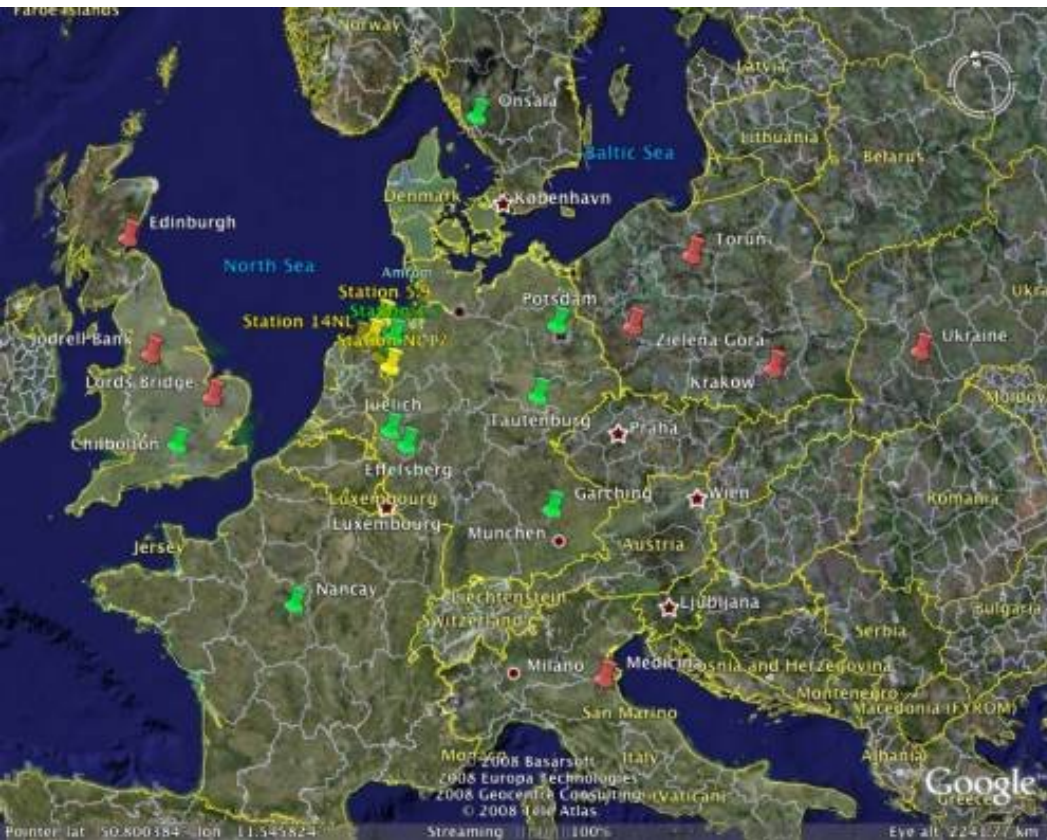

- + Beam does not rotate
- + Better tracking accuracy
- Higher cost
- Poorer gravity performance
- Non-intersecting axis

- + Lower cost
- + Better gravity performance
- Beam rotates on the sky

- + Cheap material cost
- + Constant gravity performance
- Beam does not point at target
- Station beam different for all directions on sky
- Gain different for all directions on sky
- Pushes most of the problems into software

# LOFAR:

## The Low Frequency Array

- Aperture array technology
  - digital processing
- Low Band (LBA)
  - normally 30 to 80 MHz
  - can do 10 to 80 MHz
- High Band (HBA)
  - 120 to 260 MHz
- 3<sup>rd</sup> input

- Core (2 km diameter)
- Remote (inside NL)
- International (outside NL)

Original LOFAR

Current LOFAR

- open at International stations
- extra LBA inputs for Dutch stations (better performance < 30 MHz)

# Core

- 2 km diameter
- Micky Mouse design
- Station Beam FWHM
  - 8.7 6.6 5.3 2.6°
  - 30 75 120 240 MHz
- Synthesized beam
  - 800 300 200 100''
  - 30 75 120 240 MHz

- Core area will be a nature reserve
- 96 LBA antennas (48 observing at a time) & 2 x 24 HBA tiles

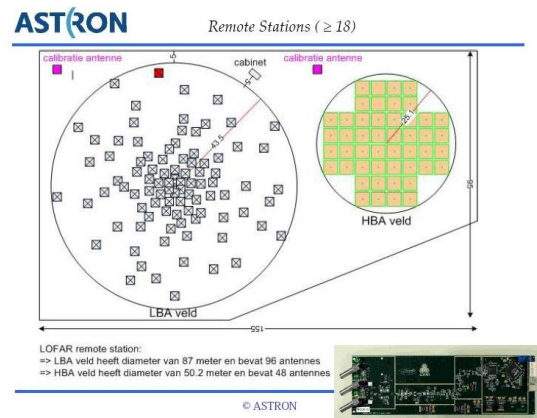

# Remote

- Up to 130 km baselines
- Circular-pair half-design
- Station Beam FWHM
  - 8.7 6.6 3.7 1.9°
  - 30 75 120 240 MHz
- Synthesized beam
  - 20 8 5 3"
  - 30 75 120 240 MHz

- 48 HBA tiles & 96 LBA (only 48 at a time used for observation)
- Station field rotation as well

# International

- ~1000 km baselines
- Original station design
- Station Beam FWHM
  - 9.9 4.0 2.5 1.2°
  - 30 75 120 240 MHz
- Synthesized beam
  - 1.7 0.7 0.4 0.2"
  - 30 75 120 240 MHz

- 96 LBA and 96 HBA tiles
- Station rotation also applied

# LBA

- Low Band Antenna
- 10 to 80 MHz
- Peak response ~56 MHz
- Normally filter out RFI below 30 MHz
- Bent dipole design

Dipole radiation patterns from Wikipedia

# LBA

- Head contains connectors for dipole wires
- Ambient temperature amplifiers

# LBA Antenna Beam

## Droopy Dipole Beam

Analytic LBA dipole model by Yatawatta

- Linear polarization dipoles
- Sensitivity strongly depends on azimuth and elevation angle
- Strong polarization leakage off-axis
  - Antennas fixed to ground, so nearly everything is off-axis
  - Leakage typically 50%
- Little polarization sensitivity at low elevations
- Strong frequency dependence
- Because of high leakage terms, need to achieve effectively just as high dynamic range as Stokes  $I$ 
  - Don't win because true  $Q$ ,  $U$ , and  $V$  are small

# HBA

- High Band Antenna
- 120—260 MHz
- Roughly uniform gain across band
- 4x4 dipole “tiles”

Figure 17 A sketch of a HBA antenna element

# HBA

- HBA frontend board
- Connects to the 4 triangular blades of the antenna system
- Ambient temperature amplifiers

# HBA Dipoles in 4x4 Tiles

# Example LOFAR Stations

Thueringer Landessternwarte/Eisloeffel

ESSEA, Bonn, 2010 Sep 28

James M Anderson

24/53

# Your Destination Tomorrow

# Grating Lobes

# Station Beam Pattern

- Primary beam and sidelobe pattern not as clean as a circular filled aperture
  - HBA grid makes an especially bad grating response
- Have to pay attention more than other telescopes to beam pattern

# LOFAR Station Hardware

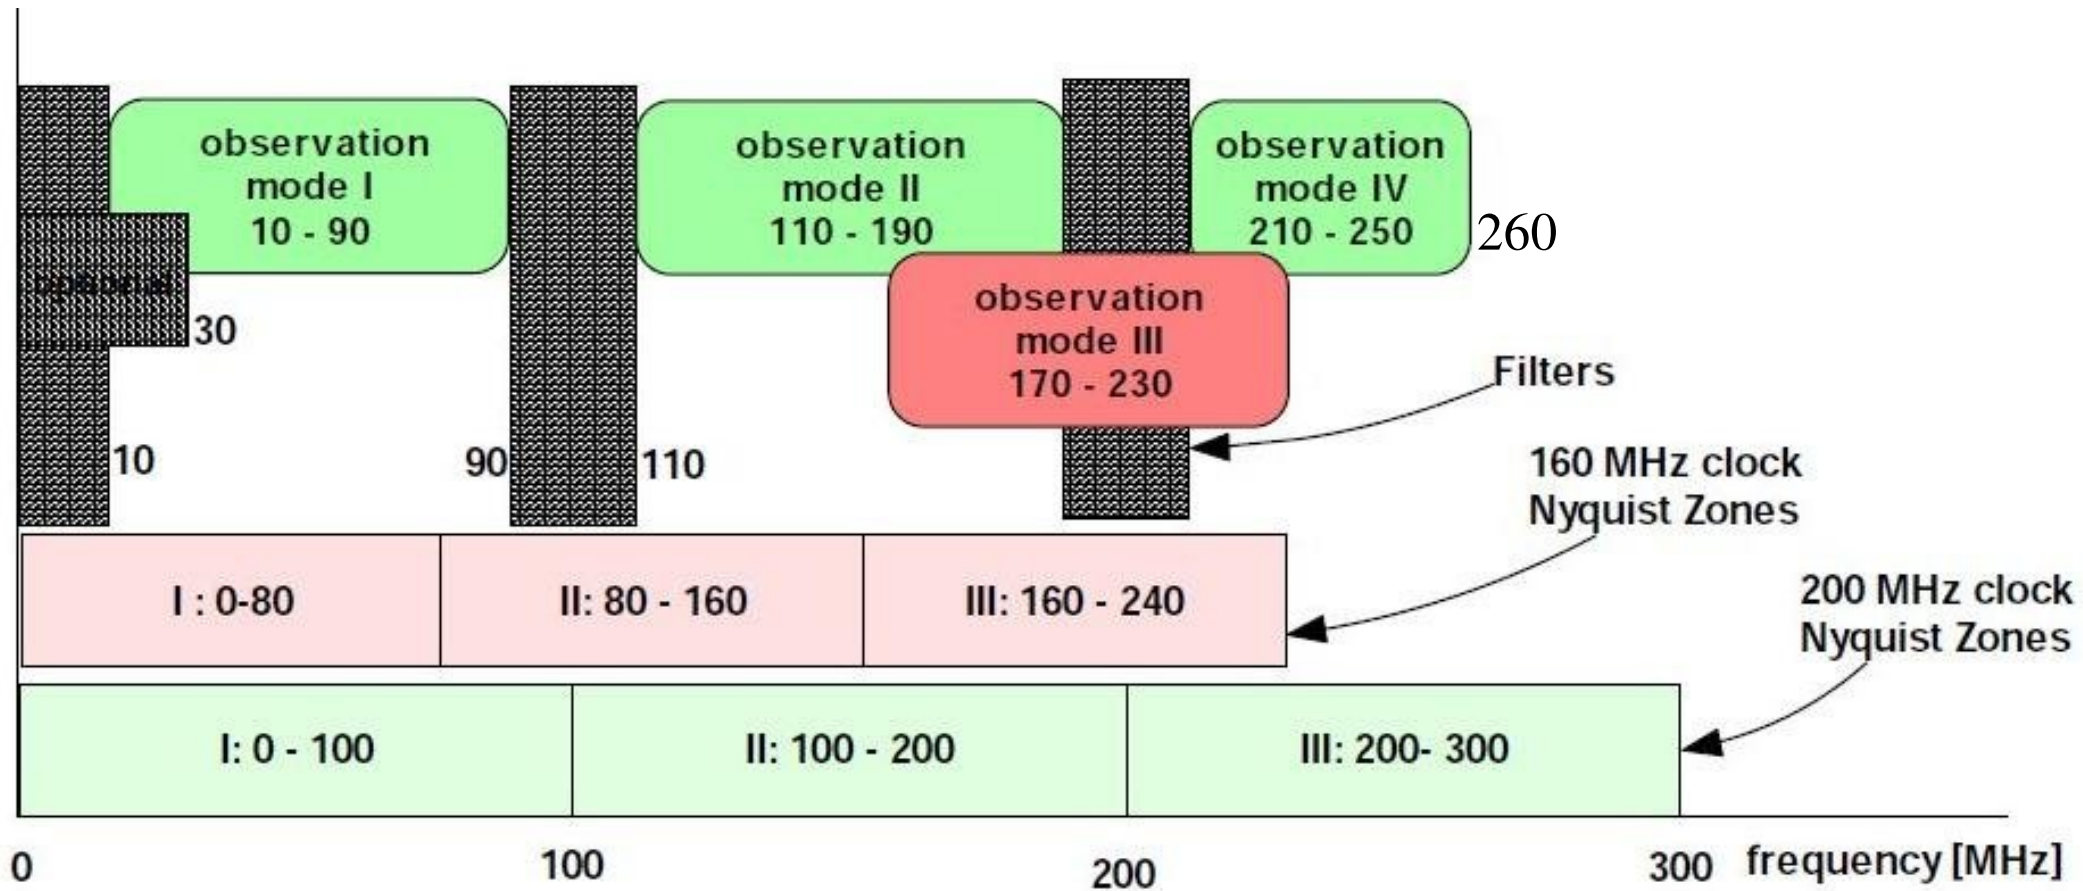

# RCU — Receiver Unit

# LOFAR Frequency Selection

# LOFAR Band Selection

# Station Electronics: Gory Details 1

- Bandpass filter
  - 10—90 MHz
  - 30—90 MHz
  - 110—190 MHz
  - 170—230 MHz
  - 210—270 MHz
- 12 bit A/D converter
  - 200 MHz or 160 MHz clock
  - Forms 100 MHz or 80 MHz bands
- RCU modes: common combinations of antenna inputs, bandpass filters, and clock rates assigned special RCU codes
  - But LOFAR can observe with any antenna input, bandpass filter, and clock rate combination
    - Low band observations with 160 MHz clock potentially important for full frequency coverage for RM synthesis and spectral line work
  - Each antenna/polarization input can chose own antenna and bandpass
    - Must use the same clock frequency

# Station Electronics: Gory Details 2

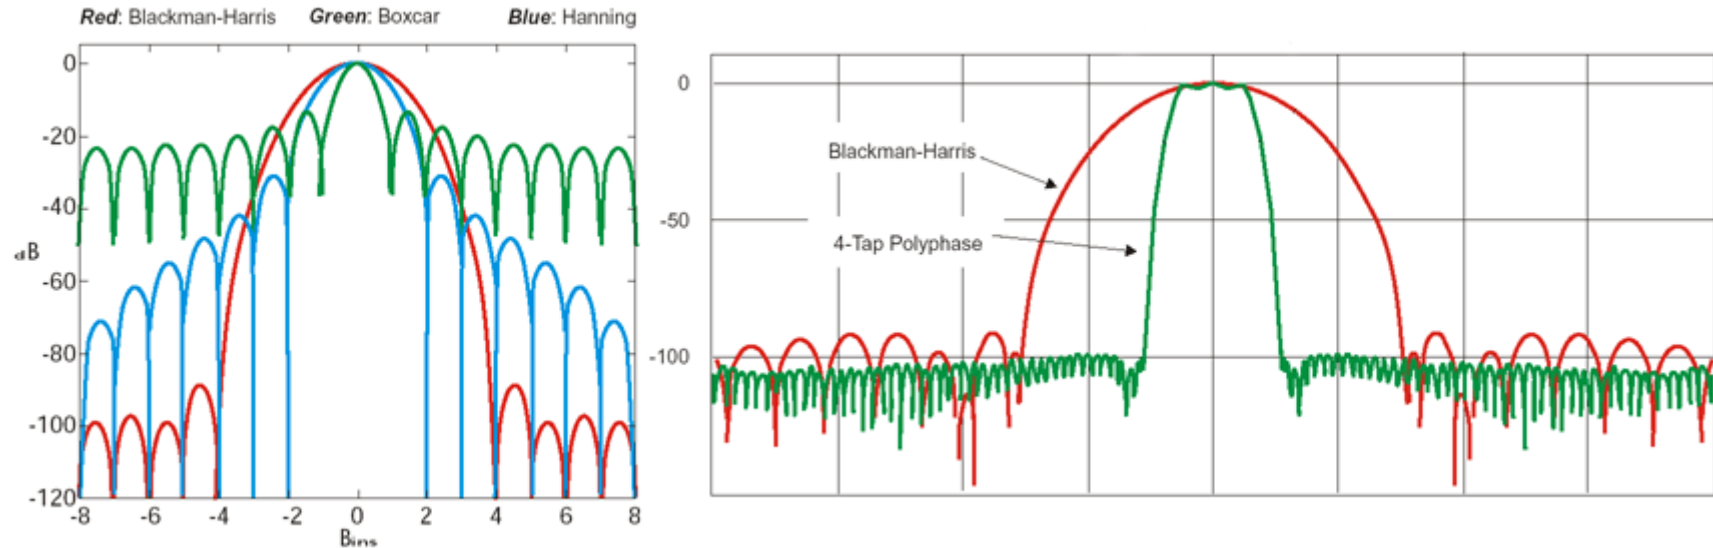

- Polyphase filterbank converts the time series data from each dipole/tile into **512** <sup>(513)</sup> **frequency subbands**
  - 195.3125 kHz subbands for 200 MHz clock
  - 156.2500 kHz subbands for 160 MHz clock
  - **16 bit complex number** (16 bit real, 16 bit imaginary) **for each subband every 5.12  $\mu$ s** (200 MHz) or **6.40  $\mu$ s** (160 MHz clock)
- Beamformer hardware processes up to **248** beamlets
  - A beamlet is one subband beamformed for a specific direction
  - 248 beamlets determine maximum bandwidth available to beamformer
    - 48.4375 MHz for 200 MHz clock
    - 38.7500 MHz for 160 MHz clock
  - **Arbitrary subband selection by astronomer**
  - **Frequency coverage not required to be contiguous**
  - Calibration will work best in full production system with wide **frequency coverage**

# Station Electronics: Gory Details 3

- 16 bit complex samples — total bandwidth 48.4375, 38.7500 MHz
  - 1 beam  $\leq$  248 subbands (48.4375, 38.7500 MHz for 200, 160 MHz clock)
  - 2 beams  $\leq$  124 subbands each (24.22, 19.38 MHz), may reuse subbands across beams
  - 4 beams  $\leq$  62 subbands each (12.11, 9.69 MHz), may reuse subbands across beams
  - 8 beams  $\leq$  31 subbands each (6.05, 4.84 MHz), may reuse subbands across beams
  - 8 beams, arbitrary subband allocation (248 subbands total, 48.4375, 38.7500 MHz total), may reuse subbands across beams
- 8 bit complex samples — total bandwidth 96.875, 77.500 MHz
  - 2 beams of 248 subbands each (48.44, 38.75 MHz), all subbands reused
  - 4 beams of 124 subbands each (24.22, 19.38 MHz), from original 248 subband selection, may reuse subbands across beams
  - 8 beams of 62 subbands each (12.11, 9.69 MHz), from original 248 subband selection, may reuse subbands across beams
- 4 bit complex samples — total bandwidth 193.75, 155.00 MHz
  - 4 beams of 248 subbands each (48.44, 38.75 MHz), all subbands reused
  - 8 beams of 124 subbands each (24.22, 19.38 MHz), from original 248 subband selection, may reuse subbands across beams
- 3 x 1 GE network bandpass limits observations to  $\sim 30.5$  (61, 122) MHz for 16 (8,4) bit modes, but full bandwidth available for all 10 GE stations

# Polyphase Filterbank

- Similar to a discrete Fourier transform (think of the FFT)
- But uses more datapoints in the transform, weighting the points differently
- Reduces sidelobe levels in frequency-space
  - Important for RFI mitigation
- Spectral dynamic range is normally greater than 80 dB for standard LOFAR data processing

# LOFAR Stations Are Aperture Arrays

# Effelsberg 100 m

- A large dish such as the Effelsberg 100 m has many adjustable panels
- The panels are manually adjusted to phase up the dish

# GBT

- The GBT has a metrology system to monitor the positions of its panels and make continuous adjustments to keep the panels phased up (the GBT active surface)

Rachel Rosen, NRAO/AUI

# Phased Arrays

Adriaan Renting

CSIRO

James M Anderson

LOFAR

# Optical

# Equivalents

ESO/Y. Beletsky

NASA

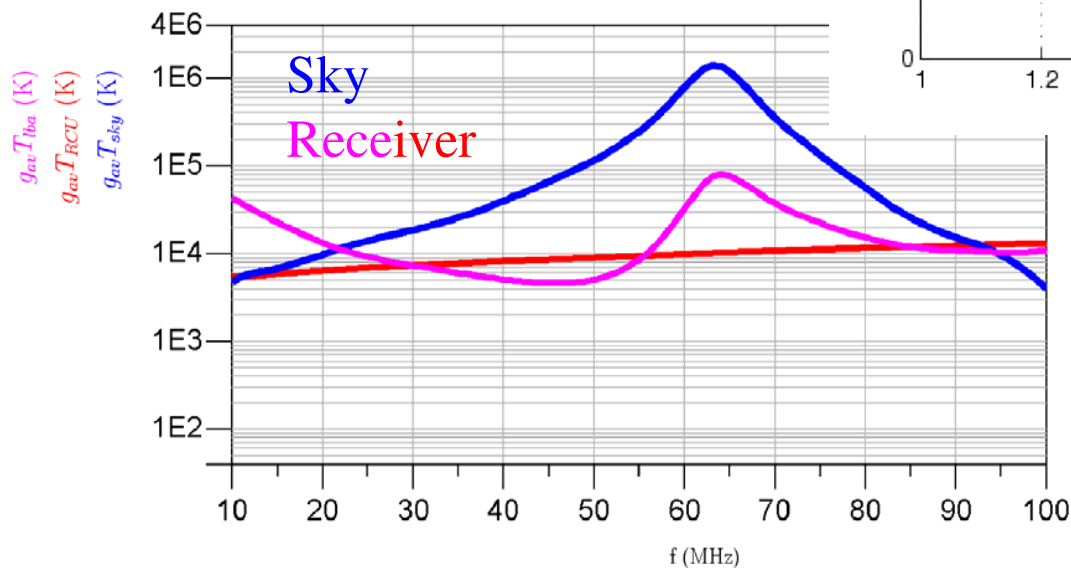

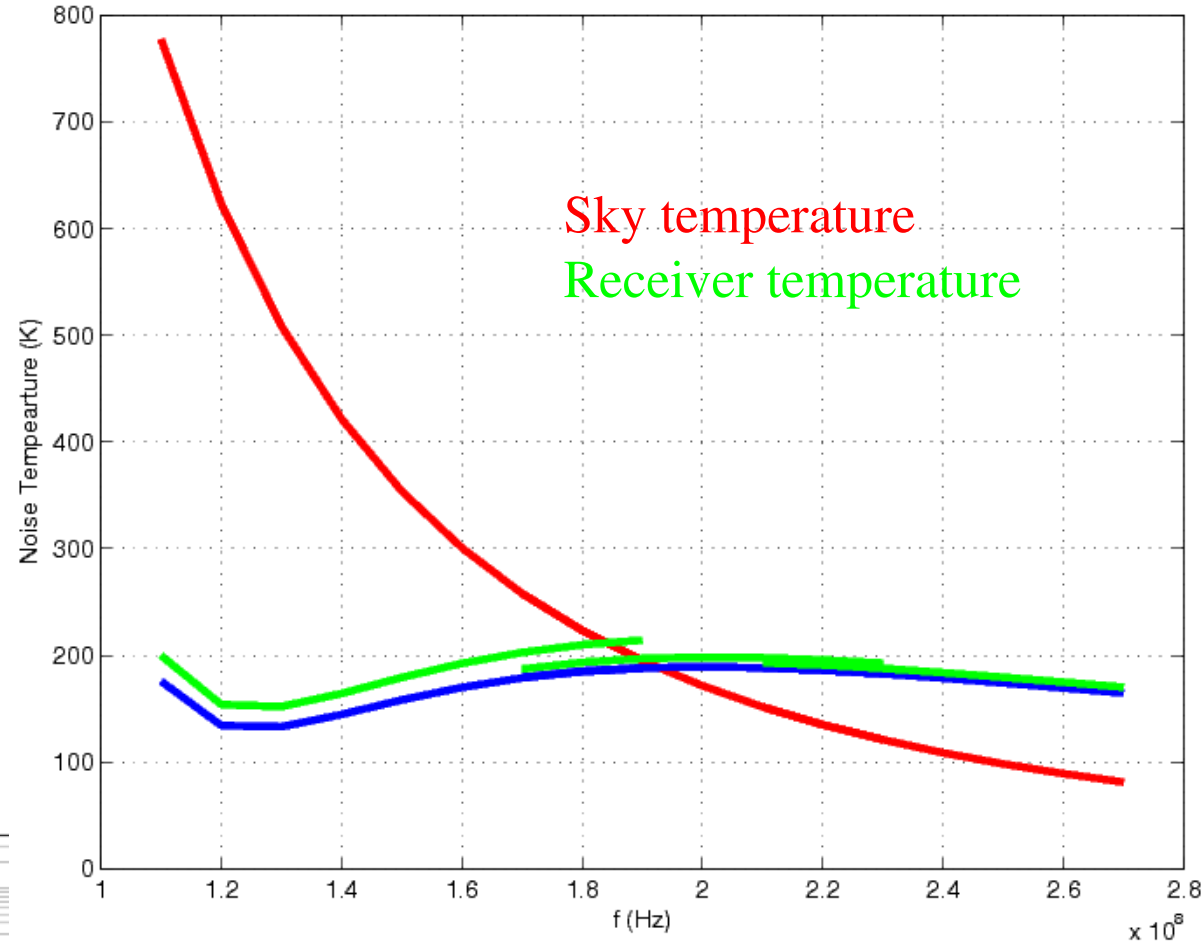

- Optical astronomy uses adjustable segmented mirrors, deformable mirrors, and adaptive optics to phase up the telescopes

# LOFAR Approach

- Rather than phasing up the telescope mechanically, LOFAR phases up a station electronically
- Instead of adjusting the position of each element of the station, the delay from each element is electronically adjusted
- Cheap hardware costs — no moving parts :)
- Everything drive by software :(

# LOFAR System Temperatures

# LOFAR and RFI

- Strong RFI is present at low frequencies, especially  $< 30$  MHz
- RFI is especially problematic for single dish work

The spectral dynamic range of the LOFAR hardware helps to minimize the problem

- RFI does not spread in frequency unless the RFI is so strong that it overruns the linear range of the amplifier or A/D converter

# So What Can You Do With LOFAR?

## 2nd LOFAR Single Station Meeting

A group of approximately 15 people are seated around a long, rectangular table in a large, well-lit room with large windows. They appear to be in a meeting or discussion. The room has a high ceiling and a carpeted floor. The image is framed by a white border.

B0329.dat

# Pulsar Physics

- Pulsars normally have very steep spectra, so low frequencies are ideal for some measurements
- **LOFAR pulsar survey expects to find ~1000 new pulsars**
- Many of these pulsars may only be visible at low frequencies
  - Regular timing observations can be carried out by individual LOFAR stations
- Extended frequency coverage helps to study emission region physics

Pulsar Science Working Group

# All-Sky Imaging

- Image shows the first LOFAR all-sky image using standard HBA station made with Effelsberg on 2009 November 10
- International stations important for imaging large spatial scales for Milky Way and large objects
- Useful for transient searches
  - $2\pi$  instantaneous field of view
- Technically not “single dish” work, as this is really interferometry
  - So we won't cover this in the

# Planets

LOFAR  
(Stokes I)

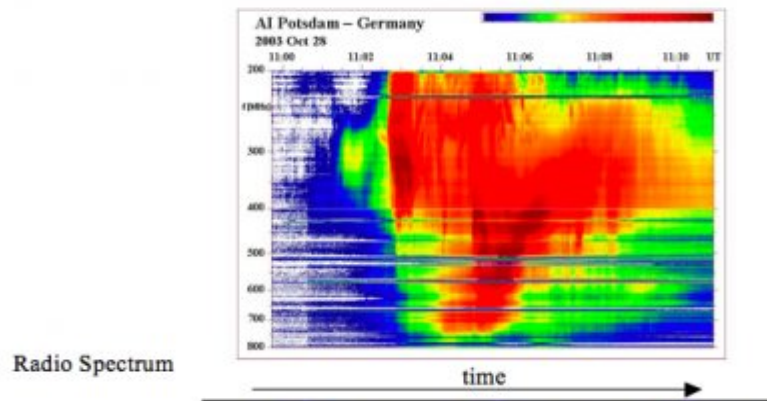

Nancay  
(ILHC)

Griessmeier 2010

- Simultaneous observation of Jupiter bursts with Nancay and a LOFAR station

# Solar Spectrum

- Solar radio bursts correspond to flares in the Solar corona
- Emission frequency related to the height in the corona by the plasma physics (geosynchrotron emission)
- Complete 10—260 MHz coverage at 0.01 s resolution sought by Solar KSP
- Of course, the Sun has been rather quiet lately, but it is expected to pick up in activity...

# What We Want to Do in the Future

Haslam et al.

Jodrell-Bank 250-ft + Effelsberg 100-m + Parkes 64-m

- All-sky mapping
  - The Galactic emission is very large-scale, and zero-spacing information is critical
- Radio recombination lines
- ???

# Using LOFAR For Single-Dish Work

- Honestly, we have not worked everything out yet
  - Still under extensive development and "playing around" to see what we can do
- The ability to form multiple beams on the sky, 8 now and perhaps 24 or more in the future, opens up lots of possibilities which are impossible with other telescopes
  - Simultaneous observations of pulsars in different directions
  - Simultaneous calibration beams and multi-beam imaging with rapid changes to the beam arrangement
- Since there will be 10s of similar LOFAR stations available, simultaneous observations at different locations also open up new ideas
  - Expand frequency coverage
  - Different paths through ionosphere, Solar wind, ISM

# Final Notes On LOFAR

- LOFAR is still under extensive software development
  - Lots of software tools simply are not ready yet, or do not have full functionality
- Still a number of bugs in the LOFAR hardware/firmware system as well
- But progress is rapid, and LOFAR will soon be opened up for scientific use by astronomers

The End

# Effelsberg 100m

100m Effelsberg for  
radio astronomy
